Clay is a type of fine-grained natural soil material that contains hydrous aluminium phyllosilicates that develops plasticity when wet. Geologic clay deposits are mostly composed of phyllosilicate minerals containing variable amounts of water trapped in the mineral structure. Clays are plastic due to particle size and geometry as well as water content, and become hard, brittle and non-plastic upon drying or firing. Depending on the soil's content in which it is found, clay can appear in ...

Clay - Wikipedia

Clay Particles Clay is the smallest soil particle. If blown up to an easily visible size, compared to other soil particles, a clay particle would be the size of a golf ball. Soils classified as clay typically contain zero to 45 percent sand, zero to 45 percent silt and 50 to 100 percent clay by volume.

Grain size is the diameter of individual grains of sediment, or the lithified particles in clastic rocks. The term may also be applied to other granular materials. This is different from the crystallite size, which refers to the size of a single crystal inside a particle or grain. A single grain can be composed of several crystals. Granular material can range from very small colloidal particles, through clay, silt, sand, gravel, and cobbles, to boulders.

Grain size - Wikipedia

Clay (noun) Earth in general, as representing the elementary particles of the human body; hence, the human body as formed from such particles. Clay. To cover or manure with clay. Clay. To clarify by filtering through clay, as sugar.
