The brain is the most complex organ in our body. Indeed, it is perhaps the most complex structure we have ever encountered in nature. Both structurally and functionally, there are many peculiarities that differentiate the brain from all other organs. The brain is our connection to the world around us and by governing nervous system and higher function, any disturbance induces severe neurological and psychiatric disorders that can have a devastating effect on quality of life. Our understanding of the physiology and biochemistry of the brain has improved dramatically in the last two

decades. In particular, the critical role of cations, including magnesium, has become evident, even if incompletely understood at a mechanistic level. The exact role and regulation of magnesium, in particular, remains elusive, largely because intracellular levels are so difficult to routinely quantify. Nonetheless, the importance of magnesium to normal central nervous system activity is self-evident given the complicated homeostatic mechanisms that maintain the concentration of this cation within strict limits essential for normal physiology and metabolism. There is also considerable accumulating evidence to suggest alterations to some brain functions in both normal and pathological conditions may be linked to alterations in local magnesium concentration. This book, containing chapters written by some of the foremost experts in the field of magnesium

research, brings together the latest in experimental and clinical magnesium research as it relates to the central nervous system. It offers a complete and updated view of magnesium's involvement in central nervous system function and in so doing, brings together two main pillars of contemporary neuroscience research, namely providing an explanation for the molecular mechanisms involved in brain function, and emphasizing the connections between the molecular changes and behavior. It is the untiring efforts of those magnesium researchers who have dedicated their lives to unraveling the mysteries of magnesium's role in biological systems that has inspired the collation of this volume of work.

researchers have known about a common mineral that can effectively prevent or remedy many cardiovascular conditions. And unlike the pharmaceuticals usually prescribed, this supplement has no dangerous side effects. In this book, world-renowned cardiologist Dr. Dennis Goodman shines a spotlight on magnesium, the mineral that can maximize your heart health. The author first establishes a firm foundation for understanding heart disease, detailing its many forms and providing a brief overview of its fundamental mechanisms. Next, he examines the important role magnesium plays in many life processes and explores how a deficiency of this substance can lead to many of our nation's most common health conditions, including cardiovascular disease. The author then details magnesium's astounding benefits, not only for heart disease, but for other

health problems, including obesity, type 2 diabetes, gastrointestinal disorders, osteoporosis, and insomnia. Finally, this knowledge is put to work, as Dr.

Goodman offers clear guidelines on how to select and use magnesium supplements to greatest effect. Many drugs are designed to relieve the symptoms of heart disease, but none of them eliminates the root cause of the problem. In *Magnificent Magnesium*, you will discover how a simple all-natural mineral can improve the function of your heart and help you regain control of your health.

The State of the World's Land and Water Resources for Food and Agriculture is FAO's first flagship publication on the global status of land and water resources. It is an 'advocacy' report, to be published every three to five years, and targeted at senior level decision makers in agriculture

as well as in other sectors. SOLAW is aimed at sensitizing its target audience on the status of land resources at global and regional levels and FAO's viewpoint on appropriate recommendations for policy formulation. SOLAW focuses on these key dimensions of analysis: (i) quantity, quality of land and water resources, (ii) the rate of use and sustainable management of these resources in the context of relevant socio-economic driving factors and concerns, including food security and poverty, and climate change. This is the first time that a global, baseline status report on land and water resources has been made. It is based on several global spatial databases (e.g. land suitability for agriculture, land use and management, land and water degradation and depletion) for which FAO is the world-recognized data source. Topical and emerging issues on land and water are dealt with in an
