Colorectal Cancer Screening provides a complete overview of colorectal cancer screening, from epidemiology and molecular abnormalities, to the latest screening techniques such as stool DNA and FIT, Computerized Tomography (CT) Colonography, High Definition Colonoscopes and Narrow Band Imaging. As the text is devoted entirely to CRC screening, it features many facts, principles, guidelines and figures related to screening in an easy access format. This volume provides a complete guide to colorectal cancer screening which will be informative to the subspecialist as well as the primary care practitioner. It represents the only text that provides this up to date information about a subject that is continually changing. For the primary practitioner, information on the guidelines for screening as well as increasing patient participation is presentedd. For the subspecialist, information regarding the latest imaging techniques as well as flat adenomas and chromoendoscopy are covered. The section on the molecular changes in CRC will appeal to both groups. The text includes up to date information about colorectal screening that encompasses the entire spectrum of the topic and features photographs of polyps as well as diagrams of the morphology of polyps as well as photographs of CT colonography images. Algorithms are presented for all the suggested guidelines. Chapters are devoted to patient participation in screening and risk factors as well as new imaging technology. This useful volume explains the rationale behind screening for CRC. In addition, it covers the different screening options as well as the performance characteristics, when available in the literature, for each test. This volume will be used by the sub specialists who perform screening tests as well as primary care practitioners who refer patients to be screened for colorectal cancer.

Abstract Medicare/MediCal patients undergoing colonoscopy procedures at East Bay Endoscopy Center (EBEC), were found to have inadequate cleansing of the bowel due to poor compliance and adherence to prep instructions. Poor health literacy affects the vulnerable population seen in Medicare/MediCal patients which in turn contributes to poor compliance to prep instructions. Poor health literacy results in wasted time, effort, money, prep supplies, and low patient morale. This improvement project addresses poor health literacy by enhancing pre-calls to include prep instructions. Prior to implementation of the project, data was collected over a 3-month period to find the number of cancelled procedures due to non-compliance of prep instructions. This information will be used to compare with number of cancelled procedures post-implementation of enhanced pre-calls. With the implementation of enhanced pre-calls, the aim of this project is to suggest that enhanced pre-calls that includes prep instructions are effective means of optimizing patient's health literacy when it comes to colonoscopy preparation. The clinical nurse leadership theme that best aligns with this project is outcomes management as the goal centers on improving health literacy and thereby patient outcomes (AACN, 2013). The success of colonoscopy in early detection and treatment of colonic lesions depends upon adequate bowel preparation. This study addresses factors related to the adequacy of bowel preparation for colonoscopy with a focus on patient factors including variables of demographics and compliance. The hypothesis of the study of factors related to the adequacy of bowel preparation for colonoscopy is that certain patient factors are associated with inadequate colon preparation independent from preparation type or timing of the procedure. Patient related factors were compared to colonoscopy procedure completion, compliance with preparation instructions and quality of preparation. Quality of colon preparation was found to have a significant effect on procedure completion along with compliance of participants with preparation instruction and presence of side effects to the colonoscopy preparation. The only factor studied with a significant impact on compliance with preparation instructions was presence of preparation side effects. The only significant factors related to quality of preparation were presence of side effects and compliance with preparation instructions. The greatest value from this study is that it leads to additional questions for further research. The lack of significance on outcomes of general patient demographics indicates that other factors may influence patient compliance and procedure completion.
