To rewrite radicals to rational exponents and vice versa, remember that the index is the denominator and the exponent (or power) is the numerator of the exponent form. Dont forget that if there is no variable, you need to simplify it as far as you can (ex: 16 raised to the  $1/4$  power (or the 4th root of 16) would be simplified to 2).

Radical equations may have one or more radical terms and are solved by eliminating each radical, one at a time. We have to be careful when solving radical equations as it is not unusual to find extraneous solutions, roots that are not, in fact, solutions to the equation. These solutions are not due to a mistake in the solving method, but result from the process of raising both sides of an ...
