This book offers 32 texts and case studies from across a wide range of business sectors around a managerial framework for Sustainable Business. The case studies are developed for and tested in executive education programmes at leading business schools. The book is based on the premise that the key for managing the sustainable business is finding the right balance over time between managing competitiveness and profitability AND managing the context of the business with its political, social and ecological risks and opportunities. In that way, a sustainable business is highly responsive to the demands and challenges from both markets and societies and managers embrace the complexity, ambivalence and uncertainty that goes along with this approach. The book presents a framework that facilitates the adoption of best business practice. This framework leads executives through a systematic approach of strategic analysis and business planning in risk management, issues management, stakeholder management, sustainable business development and strategic differentiation, business model innovation and developing dynamic capabilities. The approach helps broaden the understanding of what sustainable performance means, by protecting business value against sustainability risks and creating business value from sustainability opportunities.

A "back-to-basics" guide to opto-electronic circuit design and construction. To successfully build and optimize opto-electronic circuits, you need to understand both the fundamentals of optics and electronics. Applied Electro-Optics provides engineers, designers and technicians with a firm background in both optical physics and circuit design. In Part I, the book introduces the basic theory of opto-electronics, including: Maxwell's equations and the wave nature of light Reflection and refraction, with extensive coverage of Snell's Law Interference phenomena and the Fabry-Perot interferometer Diffraction effects and diffraction gratings Polarization and electro-optic modulation Photons, basic quantum theory, and spectroscopic techniques Then, in Part II, the book introduces each major element of an electro-optic system. Understand semiconductor light sources such as LEDs and diode lasers. Consider optical transmitters and discover how to minimize the impact of electromagnetic interference through careful circuit location, grounding, and shielding. Review the basic structure and operation of photodiodes, phototransistors, optocouplers, and photoconductors. Then, learn practical techniques for managing the trade-offs required to integrate these devices into useful circuits. A full chapter on optical receivers

Building Systems Magazine (BSM) is an award winning United States-based trade magazine read by builders, developers and general contractors using or considering using innovative construction technologies. Once commonly known as "pre-fab," today's modern building systems employ innovative materials and techniques to create residential or commercial structures in a factory setting in a fraction of the time it takes to site build. BSM focuses mainly on log, timber frame, modular, panel, and structural insulated panel building technologies. Since factory fabrication and site preparation take place simultaneously, structures are finished and ready for occupancy in weeks, rather than months or years as required by conventional site-building schedules.
