This study investigated the effect that the International Baccalaureate Mathematical Studies SL course had on the Kentucky Core Content Test and ACT. The subjects of this study were 11th grade students from a high-needs, inner-city public school in northern Kentucky who were enrolled in the IB Math course. These students were administered the tests and their scores were compared to the scores of matched students in the same school, race, gender, and socio-economic status (as determined by lunch subsistence levels). The results were analyzed to determine if students who took the IB course of study during their junior year scored higher on high-stakes tests than students who took other mathematics courses. The results of the study indicated that the students who took the IB course scored significantly higher on both tests which suggest that the completion of the IB curriculum may result in increased scores on high-stakes test scores.

This book takes a fresh look at programs for advanced studies for high school students in the United States, with a particular focus on the Advanced Placement and the International Baccalaureate programs, and asks how advanced studies can be significantly improved in general. It also examines two of the core issues surrounding these programs: they can have a profound impact on other components of the education system and participation in the programs has become key to admission at selective institutions of higher education. By looking at what could enhance the quality of high school advanced study programs as well as what precedes and comes after these programs, this report provides teachers, parents, curriculum developers, administrators, college science and mathematics faculty, and the educational research community with a detailed assessment that can be used to guide change within advanced study programs.
