~~Manual On Detailed Technical Specifications For The~~

A technical specification (tech spec) is a document that explains what a product or project will do and how you'll achieve these goals. In a tech spec, show your client and team members what problem you're solving, the goals or requirements for your project or product, and how you plan to achieve this.

A specification often refers to a set of documented requirements to be satisfied by a material, design, product, or service. A specification is often a type of technical standard.. There are different types of technical or engineering specifications (specs), and the term is used differently in different technical contexts.

Part 1 - Air-ground applications -- pt. 2 - Ground-ground applications - Air Traffic Services Message handling (ATSMHS) -- pt. 3 - Upper Layer Communications Service (ULCS) and Internet Communications Service (ICS) -- pt. 4 - Directory services, security and systems management.

There are well-founded concerns that current air transportation systems will not be able to cope with their expected growth. Current processes, procedures and technologies in aeronautical communications do not provide the flexibility needed to meet the growing demands. Aeronautical communications is seen as a major bottleneck stressing capacity limits in air transportation. Ongoing research projects are developing the fundamental methods, concepts and technologies for future aeronautical communications that are required to enable higher capacities in air transportation. The aim of this book is to edit the ensemble of newest contributions and research results in the field of future aeronautical communications. The book gives the readers the opportunity to deepen and broaden their knowledge of this field. Today's and tomorrow's problems / methods in the field of aeronautical communications are treated: current trends are identified; IPv6 aeronautical network aspect are covered; challenges for the satellite component are illustrated; AeroMACS and LDACS as future data links are investigated and visions for aeronautical communications are formulated.

Silicon technology now allows us to build chips consisting of tens of millions of transistors. This technology promises new levels of system integration onto a single chip, but also presents significant challenges to the chip designer. As a result, many ASIC developers and silicon vendors are re-examining their design methodologies, searching for ways to make effective use of the huge numbers of gates now available. These designers see current design tools and methodologies as inadequate for developing million-gate ASICs from scratch. There is considerable pressure to keep design team size and design schedules constant while design complexities grow. Tools are not providing the productivity gains required to keep pace with the increasing gate counts available from deep submicron technology. Design reuse - the use of pre-designed and pre-verified cores - is the most promising opportunity to bridge the gap between available gate-count and designer productivity. Reuse Methodology Manual for System-On-A-Chip Designs outlines an effective methodology for creating reusable designs for use in a System-on-a-Chip (SoC) design methodology. Silicon and tool technologies move so quickly that no single methodology

can provide a permanent solution to this highly dynamic problem. Instead, this manual is an attempt to capture and incrementally improve on current best practices in the industry, and to give a coherent, integrated view of the design process. From the Foreword `Synopsys and Mentor Graphics have joined forces to help make IP reuse a reality. One of the goals of our Design Reuse Partnership is to develop, demonstrate, and document a reuse-based design methodology that works. The Reuse Manual (RMM) is the result of this effort.' Aart J. de Geus, Synopsys, Inc. Walden C. Rhines, Mentor Graphics Corporation

Taking as its point of departure the fundamental observation that games are both technical and symbolic, this collection investigates the multiple intersections between the study of computer games and the discipline of technical and professional writing. Divided into five parts, Computer Games and Technical Communication engages with questions related to workplace communities and gamic simulations; industry documentation; manuals, gameplay, and ethics; training, testing, and number crunching; and the work of games and gamifying work. In that computer games rely on a complex combination of written, verbal, visual, algorithmic, audio, and kinesthetic means to convey information, technical and professional writing scholars are uniquely poised to investigate the intersection between the technical and symbolic aspects of the computer game complex. The contributors to this volume bring to bear the analytic tools of the field to interpret the roles of communication, production, and consumption in this increasingly ubiquitous technical and symbolic medium.

Professionals in local and national government and in the private sector frequently need to draw on Geographical Information Systems (GIS), Remote Sensing (RS) and Global Positioning Systems (GPS), often in an integrated manner. This manual shows a hands-on operator how to work across the range of geospatial science and technology, whether as a use

The FAO/WHO Manual on development and use of FAO and WHO specifications for pesticides contains general principles and methodologies of the work undertaken by JMPS, is the continuous evaluation of new scientific developments and guidance documents. The Manual gives the historical background of the operation of the JMPS and describes the purpose of the work. The Manual is also used by countries as a guidance document in setting pesticide specifications. This 3rd revision of the Manual contains new methodologies/principles developed in recent 5 years and incorporates the current working principles applied by the JMPS.

Far too many companies have developed outsourcing agreements that were created for a bygone century. Or worse, they are buying strategic services using an overly simplified commodity approach. Today's companies must build deep collaborative relationships with their suppliers that can accelerate the pace of innovation and competitive advantage amidst a new era of continual change and transformational shifts. This requires adopting a new methodology that has the inherent framework to design new levels of collaboration to drive business value. This new methodology is Vested Outsourcing. The Vested Outsourcing Manual is the companion guide to the ground-breaking book, Vested Outsourcing: Five Rules That Will Transform Outsourcing. The break-out book introduced the research study conducted by The University of Tennessee and challenged the conventional approach to how companies outsource. In The Vested Outsourcing Manual, Kate Vitasek and her co-authors have taken the Five Rules of Vested Outsourcing and developed the roadmap to creating a Vested Agreement through which each party has a vested interest in mutually-defined and desired outcomes. Vested Outsourcing methodology is built on a flexible framework that lays the foundational structure for the parties to come together and create a shared vision, foster an anticipatory lens, share evolving expertise, manage change and drive the required behavior for both parties to drive innovation and mitigate risk. These flexible - vested - agreements will allow the creation of value systems that have the ability to transform every industry and society. Shared vision, desired outcomes, transparency, trust, and win-win are not simply buzz words - they are the principals and values of Vested Outsourcing, being embraced by innovative giants like Microsoft, Intel, and P&G. Now companies and their suppliers have the manual to create a business model for a new century of constant change.
