Plasmon Polaritons

Spps Introduction

Introduction

Surface plasmon

polaritons (SPPs) are

electromagnetic

waves that travel

along a metal –

dielectric or metal–air

interface, practically in

the infrared or visible

-frequency. The term

"surface plasmon

polariton" explains

Download File

PDF Surface

that the wave involves both charge motion in the metal (" surface plasmon ") and electromagnetic waves in the air or dielectric (" polariton ").

excitations lie on the
right of the light line.

Radiation into metal
occurs if $\epsilon > \epsilon_p$.

Between the bound
and the radiative
regime ϵ is imaginary
 ϵ no propagation for
small k ($< IR$), ϵ is
close to k_0 and the
light line for large k ,
 $\epsilon_{sp} = \epsilon_p / (1 + \epsilon^2)^{1/2} \sim$
 $\sim \epsilon_p / (2)^{1/2}$.
