A three-phase motor must be wired based on the diagram on the faceplate. The first step is to figure out the voltage of your phases. In the United States, for low voltage motors (below 600v), you can expect either 230v or 460v. That being said, there is a wide range of different motors and what you have on hand can be completely different. Make sure that the voltage you will be supplying to your motor matches the specifications on the faceplate.

Out of these, the three phase BLDC is the most common one. The following image shows the cross-section of a BLDC Motor. As you can see in the image, a BLDC Motor consists of two main parts: a stator and a rotor. Stator. The structure of the stator of a BLDC Motor is similar to that of an induction motor. It is made up of stacked steel laminations with axially cut slots for winding.

~~What is a Motor Winding: Types and Its Calculation~~

A three phase induction motor is a type of AC induction motors which operates on three phase supply as compared to the single phase induction motor where single phase supply is needed to operate it. The three phase supply current produces an electromagnetic field in the stator winding which leads to generate the torque in the rotor winding of three phase induction motor having magnetic field.
